Data Driven Conditional Optimal Transport

Esteban G Tabak[1], Giulio Trigila[2], Wenjun Zhao[1]

Overview

A data driven procedure is developed to compute the optimal map $y = T(x, z)$ between two conditional probabilities $\rho(x|z_1, ..., z_L)$ and $\mu(y|z_1, ..., z_L)$ depending on a set of covariates z_i. The procedure is tested on:

- ACIC Data Analysis Challenge 2017 dataset;
- non uniform lightness transfer between images;
- fresco restoration in the Sistine Chapel.

Formulations

Consider the conditional optimal transport between $\rho(:|z)$ and $\mu(:|z)$.

- **Equality constrained formulation**:

$$\forall z \begin{cases} \min\limits_{T(:,z)} \int c(T(x,z),x)\rho(x|z)dx \\ T\#\rho(:|z) = \mu(:|z), \text{or } : D_{KL}(T\#\rho(:|z), \mu(:|z)) = 0 \end{cases}$$

Donsker-Varadhan variational formula:

$$D_{KL}(\rho, \mu) = \max_g \left[\int g(x)\rho(x)dx - \log\left(\int e^{g(x)}\mu(x)\, dx \right) \right],$$

Chain rule of KL divergence:

$$D_{KL}(\rho_1(x|z)||\rho_2(x|z)) = D_{KL}(\rho_1(x,z)||\rho_2(x,z)) - D_{KL}(\gamma_1(z)||\gamma_2(z)).$$

- **Unconstrained Minimax formulation**:

$$\min_T \max_{g,\lambda} \int c(T(x,z),x)d\rho(x,z) + \lambda \left[\int g(T(x,z),z)d\rho(x,z) - \log\left(\int e^{g(y,z)}d\mu(y,z) \right) \right]$$

- **Data-driven version**:

$$\min_T \max_{g,\lambda} \left[\frac{1}{n} \sum_i \left(c(T(x_i,z_i),x_i) + \lambda g(T(x_i,z_i),z_i) \right) - \lambda \log\left(\frac{1}{m} \sum_j e^{g(y_j,z_j)} \right) \right].$$

Parameterization of flows

$$T^n(x^i, z^i) = E^n\left(T^{n-1}(x^i, z^i), z^i\right).$$

- Evolving Gaussian mixtures;
- Extended map compositions;
- Neural networks.

Motivation

- Determine the effect of a medical treatment or a habit on health-related variables, such as blood pressure, depending on cofactors, such as age, gender or weight.
- Address unbalanced matching problems, where the unbalance is caused by different distributions for the covariates z in the source and target distributions.
- Develop a flexible toolbox for data analysis, where the choice of which variables to condition to which others is left at the discretion of the analyst.

Application – lightness transfer

1D OT: lightness transferred;
COT: lightness transfer conditioned on color contrasts;
3D OT: lightness/color contrasts all transferred.
